smovtoCAng

Simultaneously move all 3 different Herkulex motors to 3 different desired angles

Syntax

smovtoCAng(sObject,pID1,ang1,pID2,ang2,pID3,ang3,varargin)

Description

Controlling multiple motors simultaneously by extending the original single motor controlling's packet. Note that the angle is based on calibrated position.

- Packet requires 1 byte for Playtime and 4 bytes for each motor. Eg, optional data length of 41 bytes required if sending instructions to 10 motors simultaneously.
- Default playtime value: 60 (60*11.2ms = 672ms)
- For code to be executed properly, please follow the following convention of motor ID setting: Btm max ID, Mid intermediate ID, Top min ID. Eg, Btm pID: 253, Mid pID: 252, Top pID: 251.

Input Arguments

- sObject serial port object
- pID1, pID2, pID3 integer
- ang1, ang2, ang3 integer
- varargin integer

Function Codes

```
function smovtoCAng(sObject, pID1, CAng1, pID2, CAng2, pID3, CAng3,varargin)

% Set default playtime if not provided

if nargin == 7

playtime = 672/11.2; % Default playtime value 672ms/11.2ms = 60
```

```
pTime = dec2hex(int64(playtime),2); % Value converted into hex for packet
elseif nargin == 8
   V = cell2mat(varargin); % Convert varargin into number
    playtime = V/11.2; % Convert into value
    pTime = dec2hex(int64(playtime),2);
else
    error('Please input only 7 to 8 arguments!');
end
% Initialize variables
ang = [CAng1, CAng2, CAng3];
pID = [pID1,pID2,pID3];
CVal = [512, 512, 512];
% Convert angles to respective position values
for i=1:3
    CVal(i) = fix(512 + ang(i)/0.325);
    % Check input value range for top and btm motors
    if (pID(i) ==max(pID) || pID(i) ==min(pID))
        % Using general check value function
        checkCVal(sObject, pID(i), CVal(i));
```

```
% Check middle motor specifically due to smaller range (middle bracket)
                                 else
                                                   checkCVal(sObject, pID(i), CVal(i),252);
                                 end
                end
                 % Convert values into hex for packet
                 % Byte in reverse order by Little Endian Order
                 % pos1: motor pID1, pos2: motor pID2, pos3: motor pID3
                pos1 = dec2hex(CVal(1), 4);
                pos1 = strcat(pos1(3:4), pos1(1:2));
                pos2 = dec2hex(CVal(2), 4);
                pos2 = strcat(pos2(3:4), pos2(1:2));
                pos3 = dec2hex(CVal(3), 4);
                pos3 = strcat(pos3(3:4), pos3(1:2));
                data =
